

CLIMATE CHANGE

The spotlight is now on national decision makers to shape the future of climate action, and quickly. Transparency is needed more than ever to traverse increasingly ambitious national paths.

TRANSPARENCY

NEED

42% of countries report needing support for building MRV and increased capacity

“ Taking action on climate change means continuously lowering greenhouse gas (GHG) emissions. To lower GHG emissions, all countries need to manage their carbon pollution. Lack of informed management – leads to poor decision making and a lack of accountability at multiple levels -which results in insubstantial climate action. Unfortunately, nearly half of the countries in the Paris Agreement still report needing capacity to implement their climate action plans. **The good news is, we have a plan.** ”

3,300

Deeply trained alumni in 85% of the countries party to the Paris Agreement

23

Developing country governments partnered with us on long-term capacity building

4

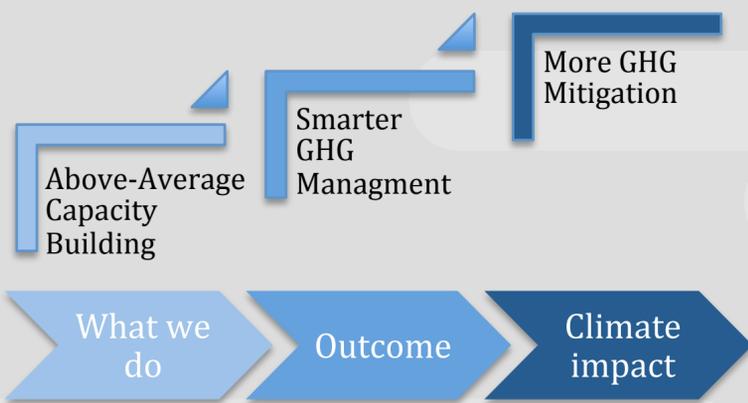

Embedded academic and institutional partnerships created to deliver training

9,000

Megatonnes of CO₂e under management by our alumni

THEORY OF CHANGE

GHGMI's impact is achieved through capacity development in applied GHG management world-wide. Our programs improve the skill-level, motivation, management structures, and resources necessary to conduct smarter and more GHG measurement, reporting, and verification (MRV) - so that all countries are managing their carbon pollution in an educated and active manner.
