INTERGOVERNMENTAL PANEL ON climate changes

## Where are we?

Since pre-industrial times, human activities have caused approximately 1.0°C of global warming.

- Already seeing consequences for people, nature and livelihoods
- At current rate, would reach 1.5°C between around 2030 and 2050
- Past emissions alone do not commit the world to 1.5°C

Global warming relative to 1850-1900 (°C)

# Cumulative emissions of CO<sub>2</sub> and future non-CO<sub>2</sub> radiative forcing determine the probability of limiting warming to 1.5°C

Faster immediate CO<sub>2</sub> emission reductions limit cumulative CO<sub>2</sub> emissions

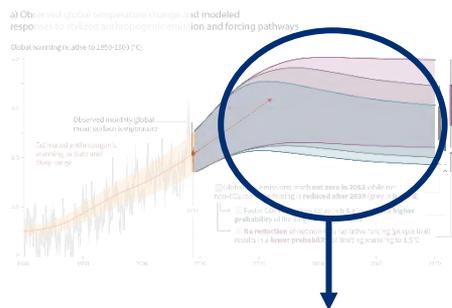

b) Stylized net global CO<sub>2</sub> emission pathways  
Billion tonnes CO<sub>2</sub> per year (GtCO<sub>2</sub>/yr)

c) Cumulative net CO<sub>2</sub> emissions  
Billion tonnes CO<sub>2</sub> (GtCO<sub>2</sub>)

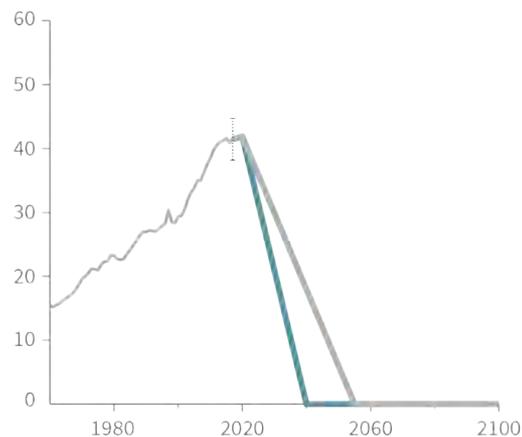

# Cumulative emissions of CO<sub>2</sub> and future non-CO<sub>2</sub> radiative forcing determine the probability of limiting warming to 1.5°C

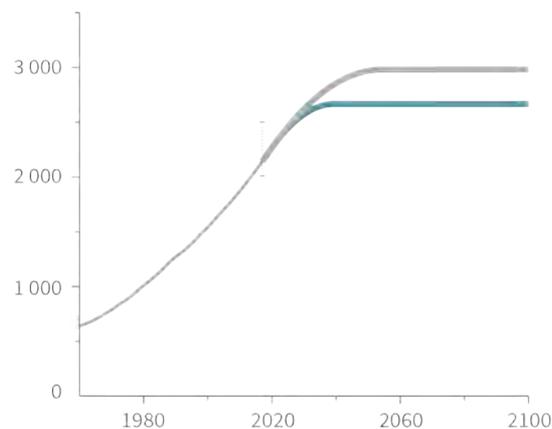

Maximum temperature rise is determined by cumulative net CO<sub>2</sub> emissions and net non-CO<sub>2</sub> radiative forcing due to methane, nitrous oxide, aerosols and other anthropogenic forcing agents.

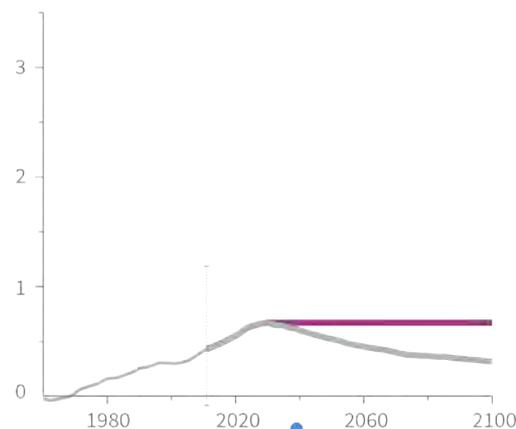

b) Stylized net global CO<sub>2</sub> emission pathways  
Billion tonnes CO<sub>2</sub> per year (GtCO<sub>2</sub>/yr)

c) Cumulative net CO<sub>2</sub> emissions  
Billion tonnes CO<sub>2</sub> (GtCO<sub>2</sub>)

d) Non-CO<sub>2</sub> radiative forcing pathways  
Watts per square metre (W/m<sup>2</sup>)

*Extreme precipitation (%)*

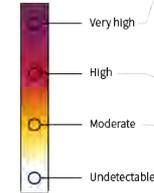

# How do climate-related risks change as a function of the level of global warming?

**Purple** indicates very high risks of severe impacts/risks and the presence of significant irreversibility or the persistence of climate-related hazards, combined with limited ability to adapt due to the nature of the hazard or impacts/risks.

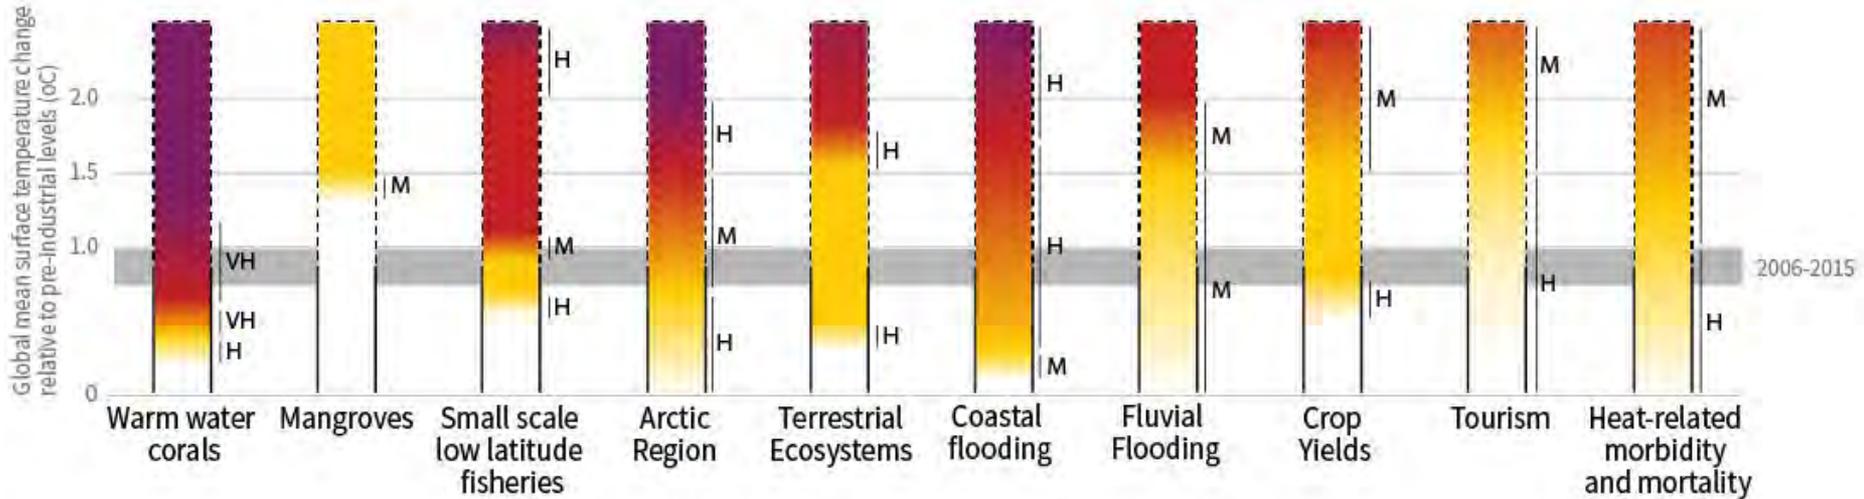

**Red** indicates severe and widespread impacts/risks.

**Yellow** indicates that impacts/risks are detectable and attributable to climate change with at least medium confidence.

**White** indicates that no impacts are detectable and attributable to climate change.

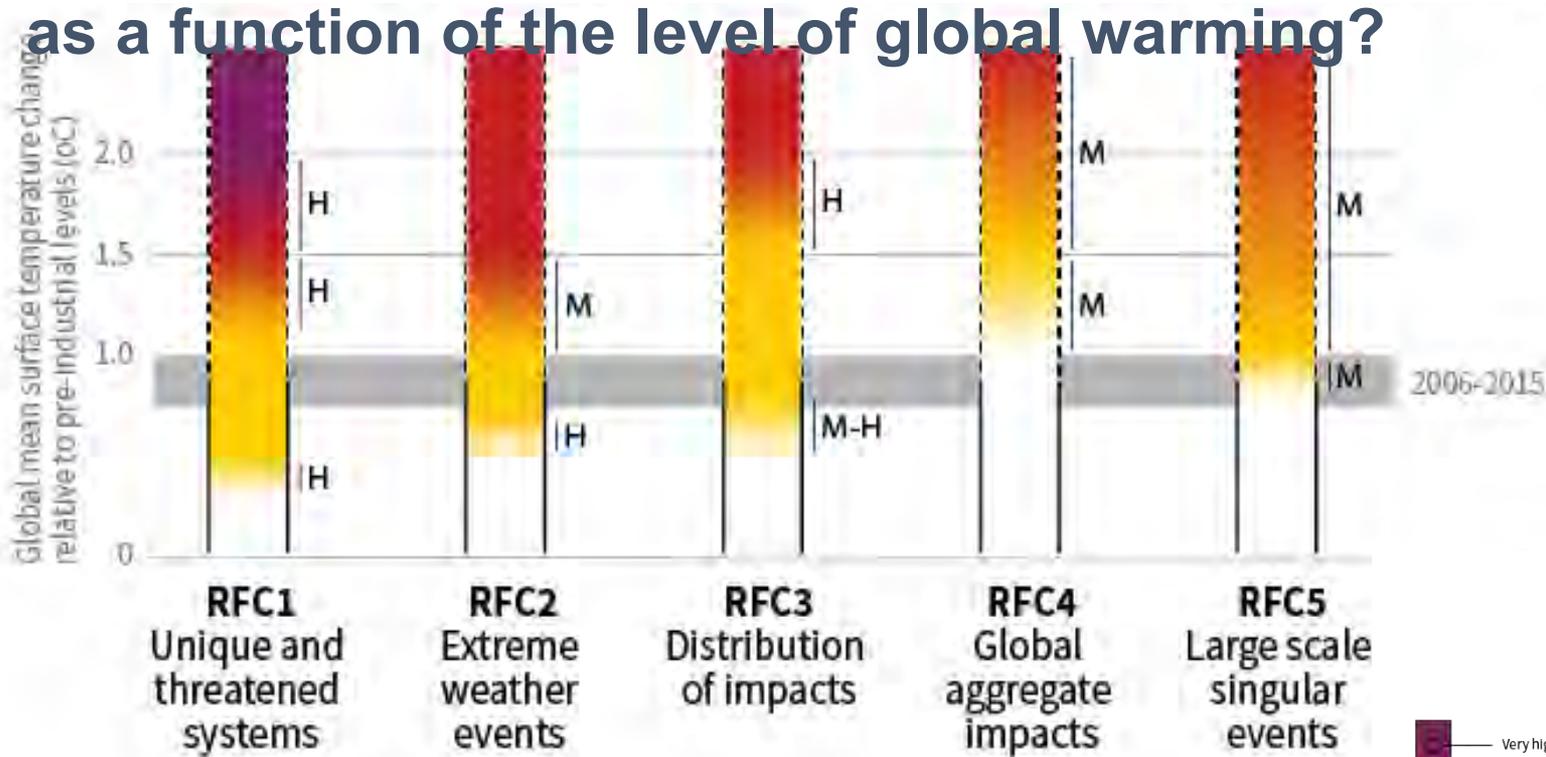

## Impacts and risks for selected natural, managed and human systems

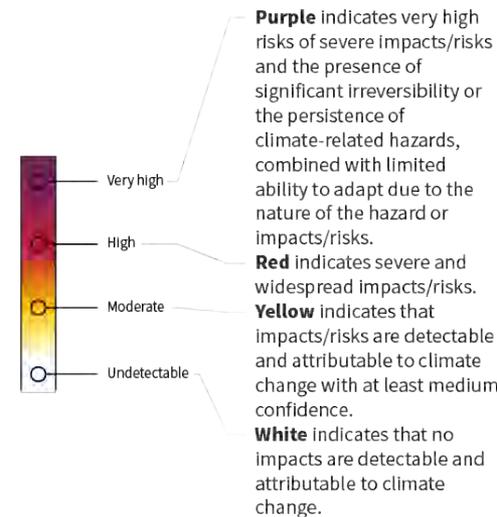

Confidence level : M, medium; H, high; VH; very high

# How do climate-related risks for “Reasons For Concern” change as a function of the level of global warming?

Confidence level : M, medium; H, high; VH; very high

## At 1.5°C compared to 2°C

- Up to several hundred million fewer people exposed to climate-related risk and susceptible to poverty by 2050
- Disproportionately high risk for Arctic, dryland regions, small island developing states and least developed countries
- Lower risks for health, livelihoods, food security, water supply, human security and economic growth
- Wide range of adaptation options which can reduce climate risks; less adaptation needs at 1.5°C

Timing of net zero CO<sub>2</sub>  
Line widths depict the 5-95th  
percentile and the 25-75th  
percentile of scenarios

Pathways limiting global warming to 1.5°C with no or low overshoot

# What are greenhouse gas emission pathways compatible with limiting warming to 1.5°C?

Global total net CO<sub>2</sub> emissions

Billion tonnes of CO<sub>2</sub>/yr

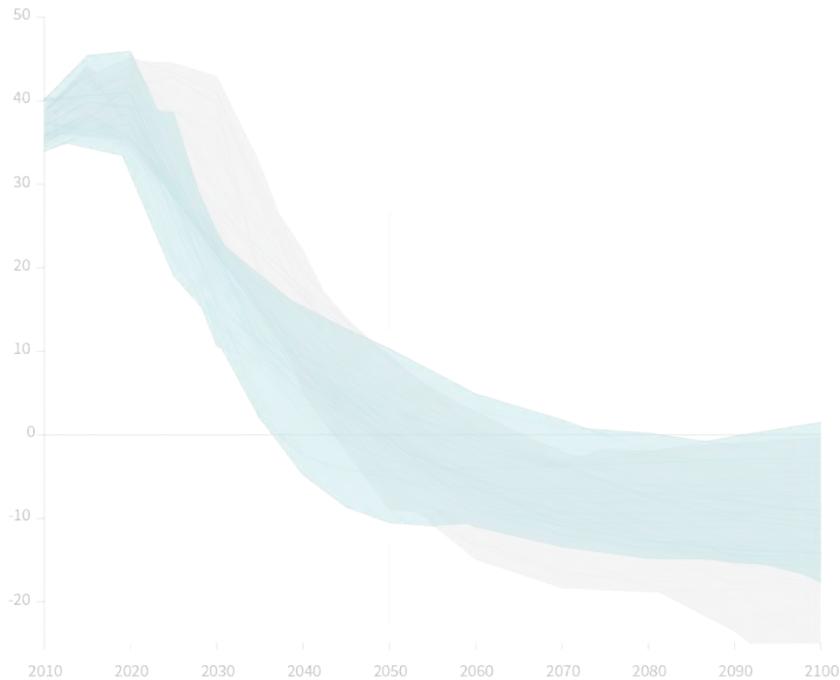

Timing of net zero CO<sub>2</sub>  
Line widths depict the 5-95th percentile and the 25-75th percentile of scenarios

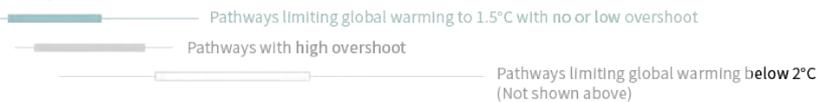

# What are greenhouse gas emission pathways compatible with limiting warming to 1.5°C?

Global total net CO<sub>2</sub> emissions

Billion tonnes of CO<sub>2</sub>/yr

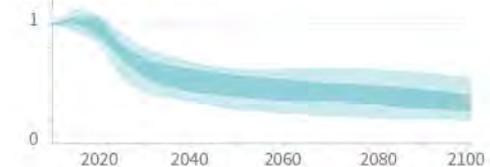

Timing of net zero CO<sub>2</sub>  
Line widths depict the 5-95th percentile and the 25-75th percentile of scenarios

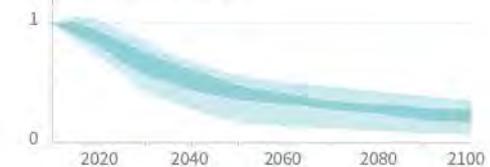

Non-CO<sub>2</sub> emissions relative to 2010

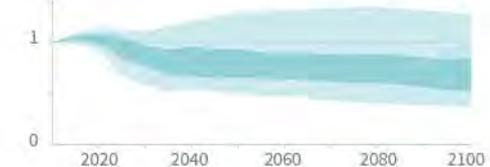

Methane emissions

Black carbon emissions

Nitrous oxide emissions

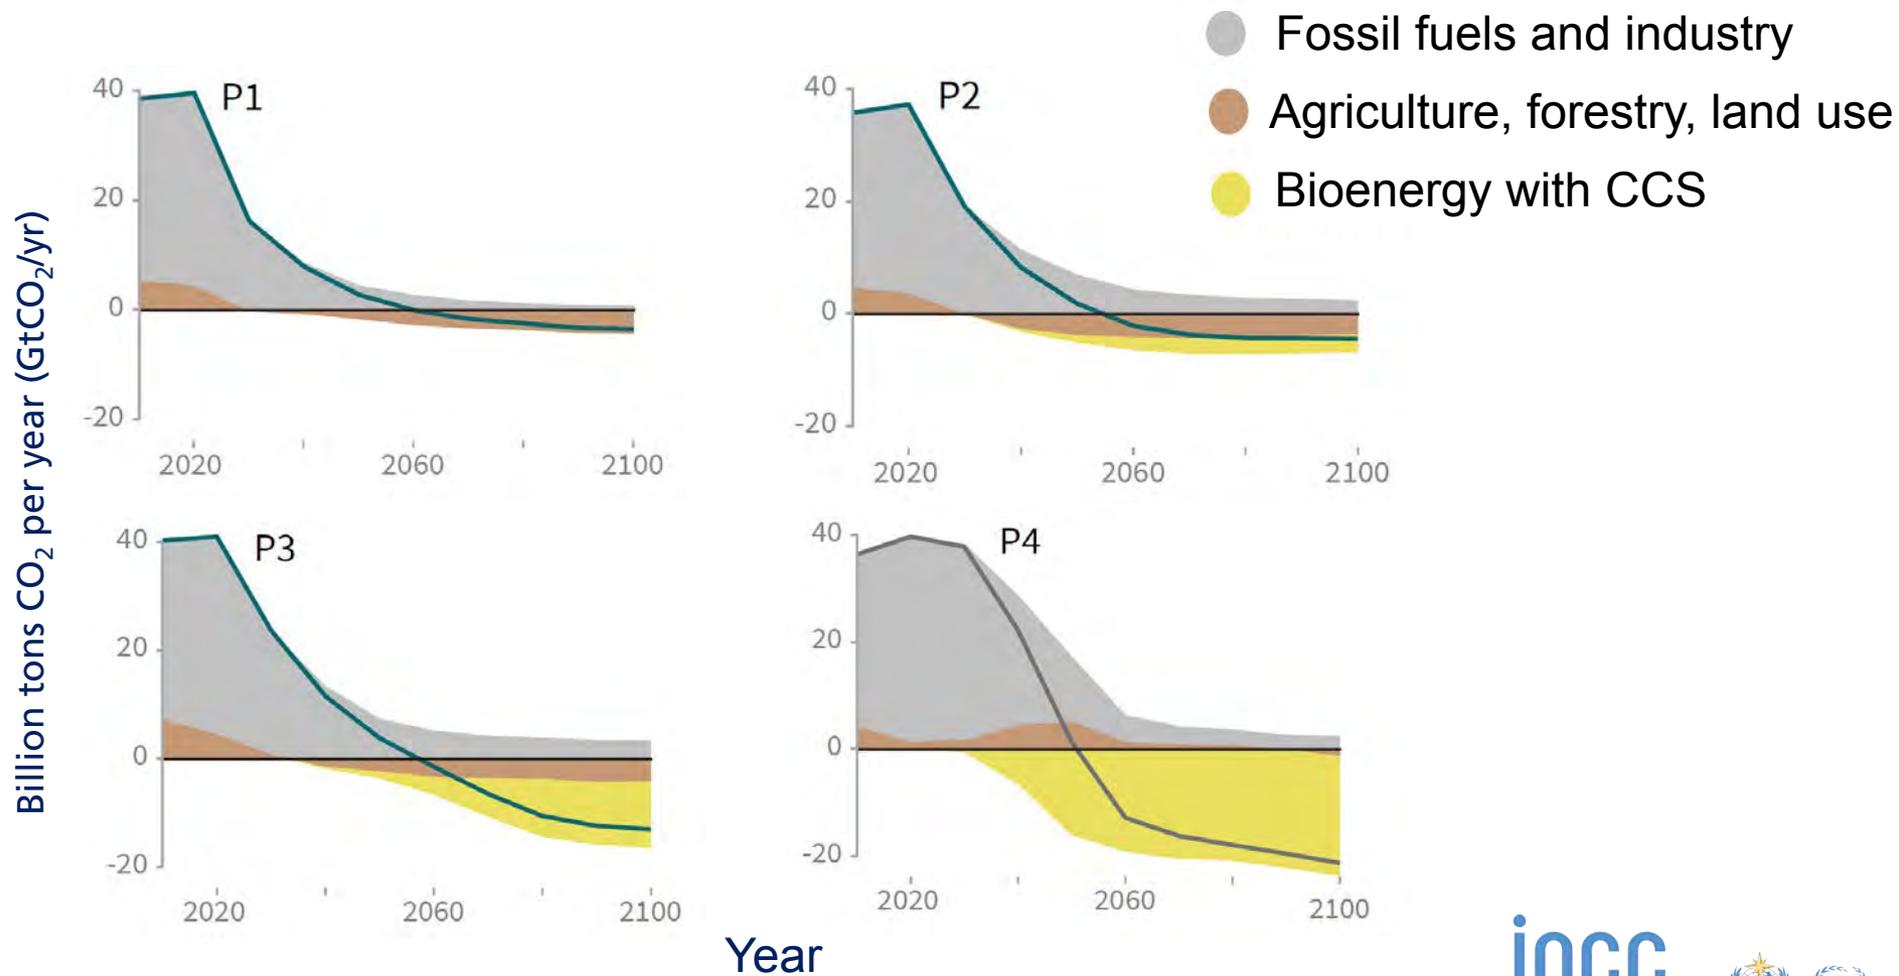

## Limiting warming to 1.5°C

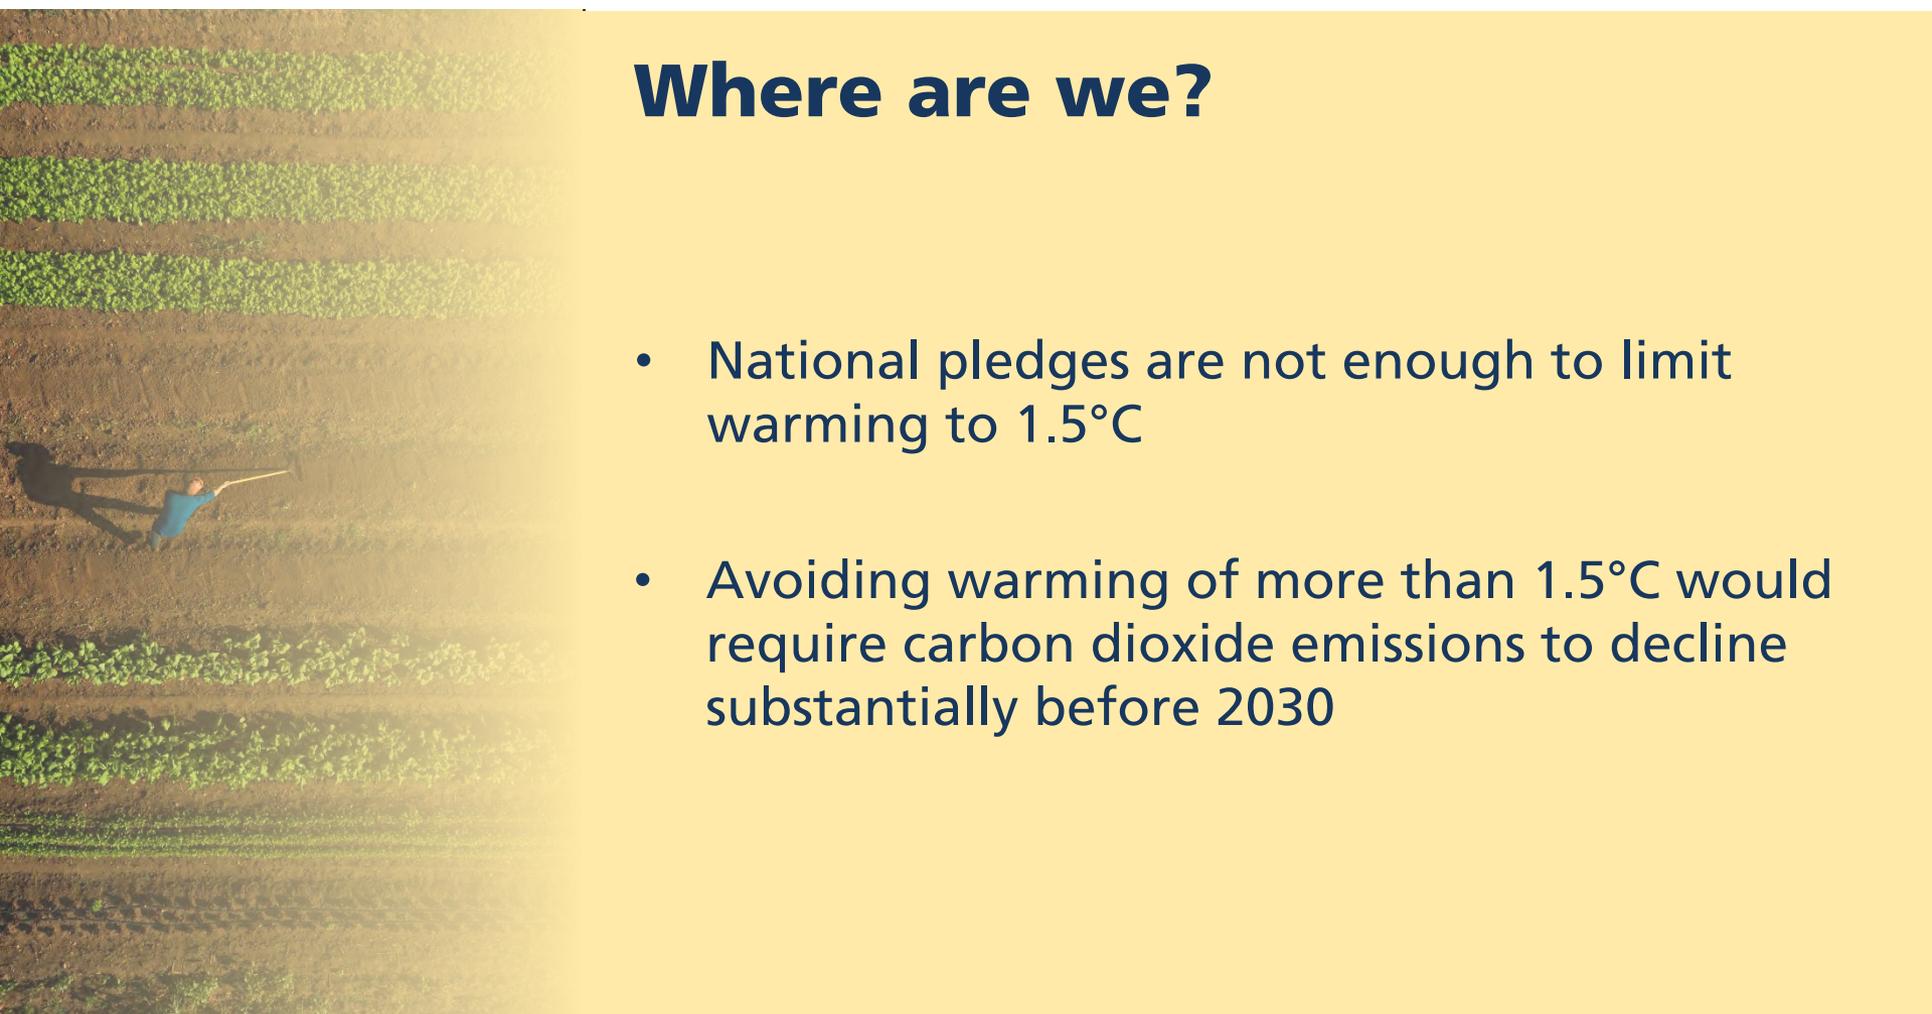

Would require rapid, far-reaching and unprecedented changes in all systems

- A range of technologies and behavioural changes
- Scale up in annual investment in low carbon energy and energy efficiency by factor of five
- Renewables supply 70-85% of electricity in 2050
- Coal declines steeply, ~zero in electricity by 2050
- Deep emissions cuts in transport and buildings
- Transitions in land use, scale depending on mitigation portfolio
- Urban and infrastructure system transitions, changes in urban planning practices

Mint Images / Aurora Photos

# Four illustrative model pathways

## Where are we?

- National pledges are not enough to limit warming to 1.5°C
- Avoiding warming of more than 1.5°C would require carbon dioxide emissions to decline substantially before 2030

# Climate change and sustainability

- Ethical and fair transitions
- Different pathways have different synergies and trade-offs with UN Sustainable Development Goals (SDGs)
- Careful mix of measures to adapt to climate change and reduce emissions can help achieve SDGs
- Low energy demand, low material consumption and low carbon food carry highest benefits
- Cooperation, governance, innovation and mobilisation of finance key for feasibility
