Averting the climate and biodiversity crises: natural solutions pivotal in delivering NDC ambitions

Time and Place

Monday 9 December 2019, 15:00 – 16:30
Room 1 (Feria de Madrid)

Wetlands, peatlands, mangroves, forests, and other primary ecosystems retain massive carbon stocks and improve resilience. Biodiversity underpins carbon storage and sequestration. Harnessing and mapping linkages between nature-rich and carbon-rich areas will catalyze higher ambition for NDCs. Moreover, the conservation, restoration and sustainable use of critical ecosystems contribute to implementing commitments under several MEAs, including the UNFCCC, the CBD, the UNCCD, the Ramsar Convention, the CMS, the Sendai Framework and the Agenda 2030.

Come share your knowledge and ideas!
