

## The engine of the cCCR

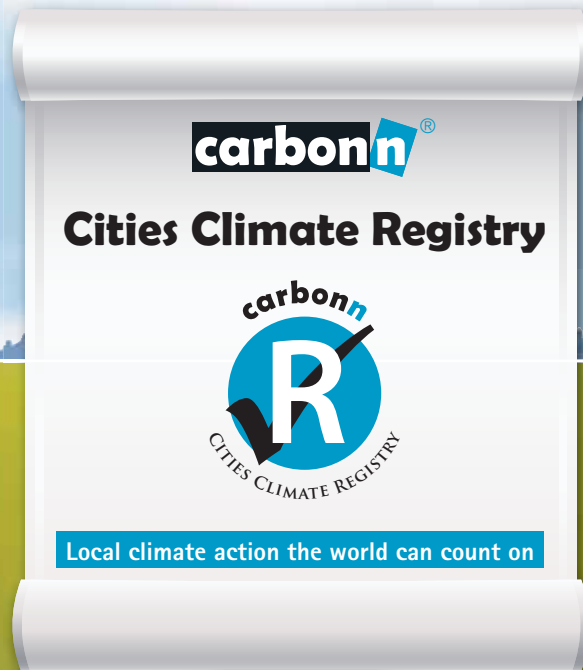

The Bonn Center for Local Climate Action and Reporting – carbonn – is the technical engine behind the cCCR.

carbonn was launched by ICLEI and the United Nations Environment Programme (UNEP) at the Copenhagen Summit (COP15) in December 2009.

## What is the carbonn Cities Climate Registry?

The carbonn Cities Climate Registry (cCCR) helps cities and local governments make climate change commitments the world can count on. It has been developed by local governments for local governments.

The cCCR enables cities and local governments to publicly register their GHG reduction **commitments**, report **performance** and showcase **actions**.

The cCCR ensures that local climate action is **measurable**, **reportable** and **verifiable**, and that data is consistent with the standards of the global climate regime.

## Why register local climate data with the cCCR?

To promote local climate action the world can count on.

**Local governments are taking a lead role in global climate protection** and have driven, mirrored and supported national and international climate processes.

The cCCR supports the global credibility of local climate action and ensures **comparability**, **transparency** and **accountability**.

Local Governments involved in the process will have continuous support in capacity and knowledge development through the services of the Bonn Center for Local Climate Action and Reporting – carbonn.
