COP 22 Side Event: Improving MRV for agricultural emission reductions in the livestock sector

**7 November 2016, 16:45- 18:15 with cocktail following
Mediterranean Room**

**Food and Agriculture
Organization of the
United Nations**

**GLOBAL
RESEARCH
ALLIANCE**

ON AGRICULTURAL GREENHOUSE GASES

Part 1:

Country experiences in improving MRV for mitigation in the livestock sector

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

Speaker 1: Walter Oyhantacabal, Ministry of Livestock, Agriculture and Fishery, Uruguay

Low-carbon development of the beef cattle sector in Uruguay

CGIAR – CCAFS – ILRI
COP22 Side event:
November 7th, 2016

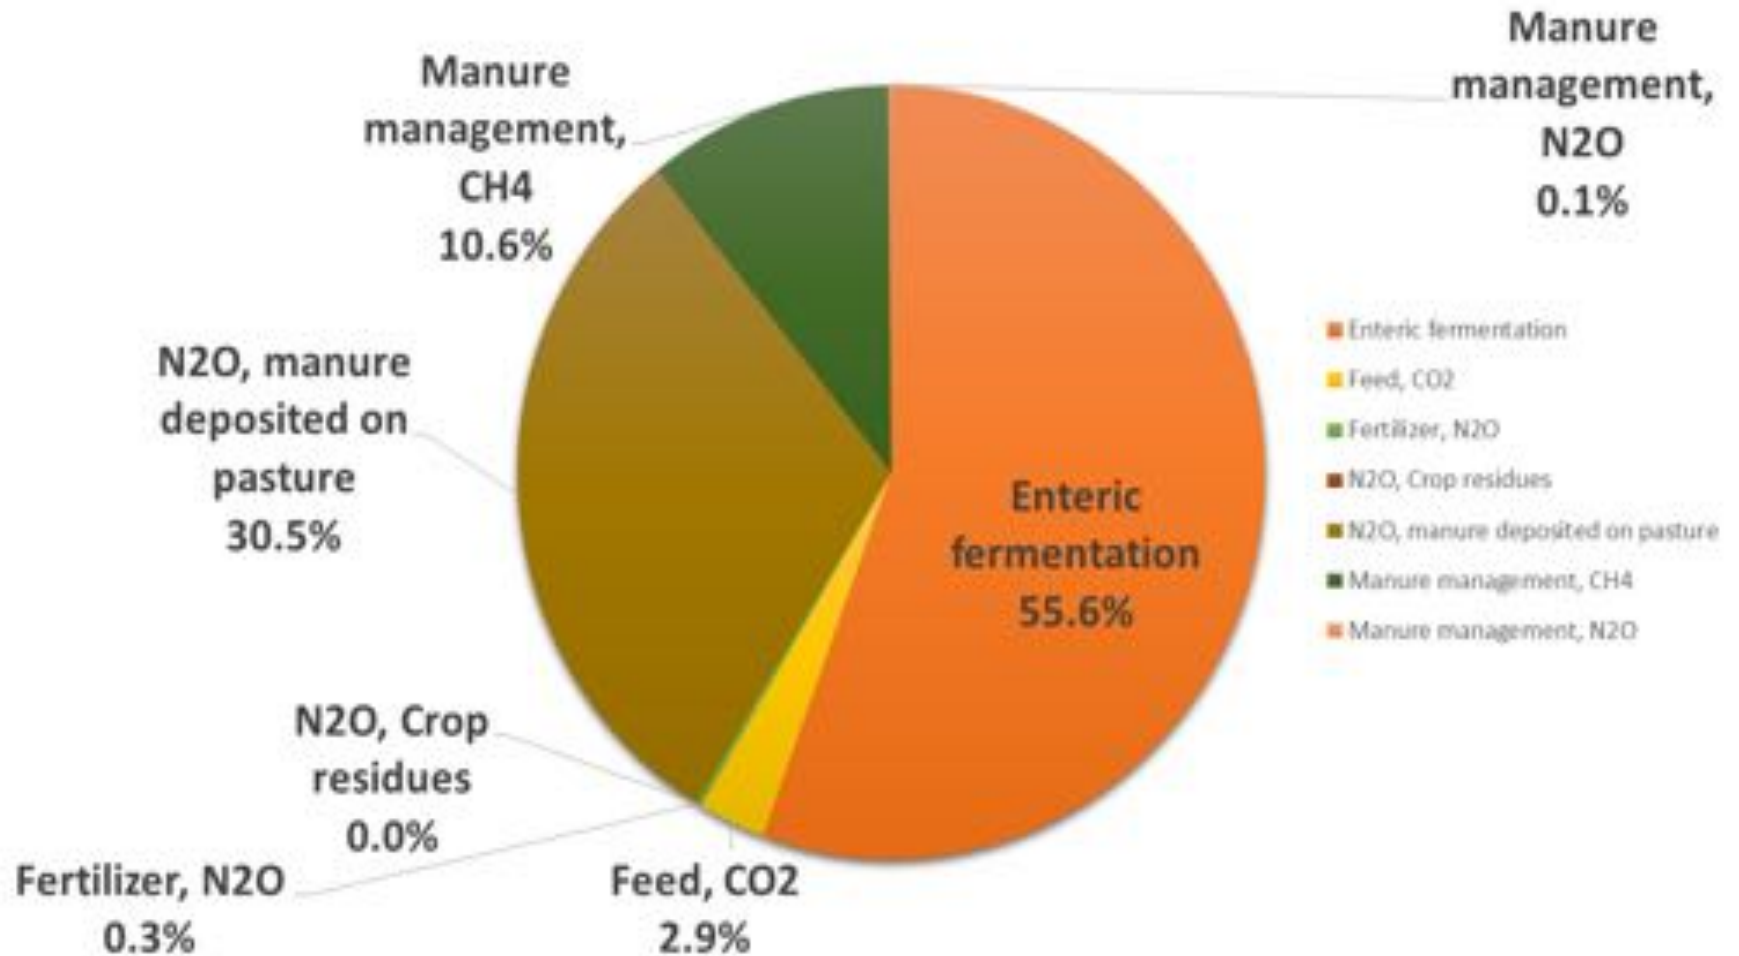

Walter Oyhantçabal

Director of the Sustainability and Climate Change Unit
Ministry of Livestock, Agriculture and Fishery - Uruguay

- Uruguay is a livestock country with an economy strongly based on the agricultural sector (70% of all exports).

75% of emissions in agriculture: main sources are...

Uruguay's iNDC: proposed mitigation targets in terms of emissions intensity in the beef sector (per kg beef) compared to 1990

	2030 vs. 1990 own effort	2030 vs 1990 with MOI	2010 vs 1990
CH₄	33% less	46% less	23% less
N₂O	31% less	41% less	28% less

Q1: Uruguay experiences in improving activity data, emission factors and coordination to best capture mitigation impacts

National (digital) Livestock Information System

**High quality livestock statistics
system**

100% traceability of the cattle herd, with electronic and visual tags

Sistema Nacional de Información Ganadera

Mesa de Ayuda GNIG y SMA
2410 2790

Centro de atención
ciudadana del MGP
2418 5634

Servicio de atención
automática
2410 7806

Annual electronic sword declararation by all farmers

- **Stock**: number of heads by category = **AD** disaggregated by small local áreas.

- **Land use** Diet, as basis for estimating sub-national **EF**

$$\text{Emissions} = \text{AD} \times \text{EF}$$

Q2: What innovations have you used to get emission factors for low emissions production systems?

- Use of spatially disaggregated information on cattle herd by category and diet quality and composition.
- **Tier 2** C-S EF for enteric fermentation including Tier 2 MCF
- **Tier 2** N₂O from manure on grassland
- Use of FAOSTAT tools for QA/QC
- GLEAM model under calibration

Q3: 🏭 How does Uruguay coordinates collection of data?

- **Agriculture statistics** are a responsibility of the Ministry of Agriculture and cover 200 local area units.
- Agriculture and LULUCF **GHG inventories** are compiled in our Ministry.
- **EFs research** is coordinated with the National Agricultural Research Institute and the Faculty of Agronomy
- This facilitates the convergence and the support to the inventory as the pillar for **MRV of NDCs and NAMAs**

REDUCING ENTERIC METHANE EMISSIONS INTENSITY THROUGH IMPROVED PRODUCTION EFFICIENCY AND PRODUCTIVITY OF CATTLE IN BEEF PRODUCTION SYSTEMS IN URUGUAY

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

Speaker 2: Agripina Jenkins, Ministry of Agriculture and Livestock, Costa Rica

The experience of Costa Rica related to MRV and the livestock sector

Agripina Jenkins Rojas

Costa Rica: livestock policy

Estrategia para la Ganadería Baja en Carbono en Costa Rica

CONCLUSION 1 IMPACT

PARTICIPATION

From pilot stage TO Sub-national stage

93 farms TO 1800 farms

SCALE UP

CONCLUSION 2 INTENSIFICATION

Promotion of sustainable intensification practices with private sector participation

Beef and milk national Production

CONCLUSION 3 Innovative financial mechanisms

Conventional financing system: Banks and financial institutions mainly interested in own profitability. Excess supply that does not fit producer needs (i.e. high interest rates, short payment periods).

Climate financing system specially designed for the livestock sector: Result based payments.

CONCLUSION 4 Contribution to INDC's:

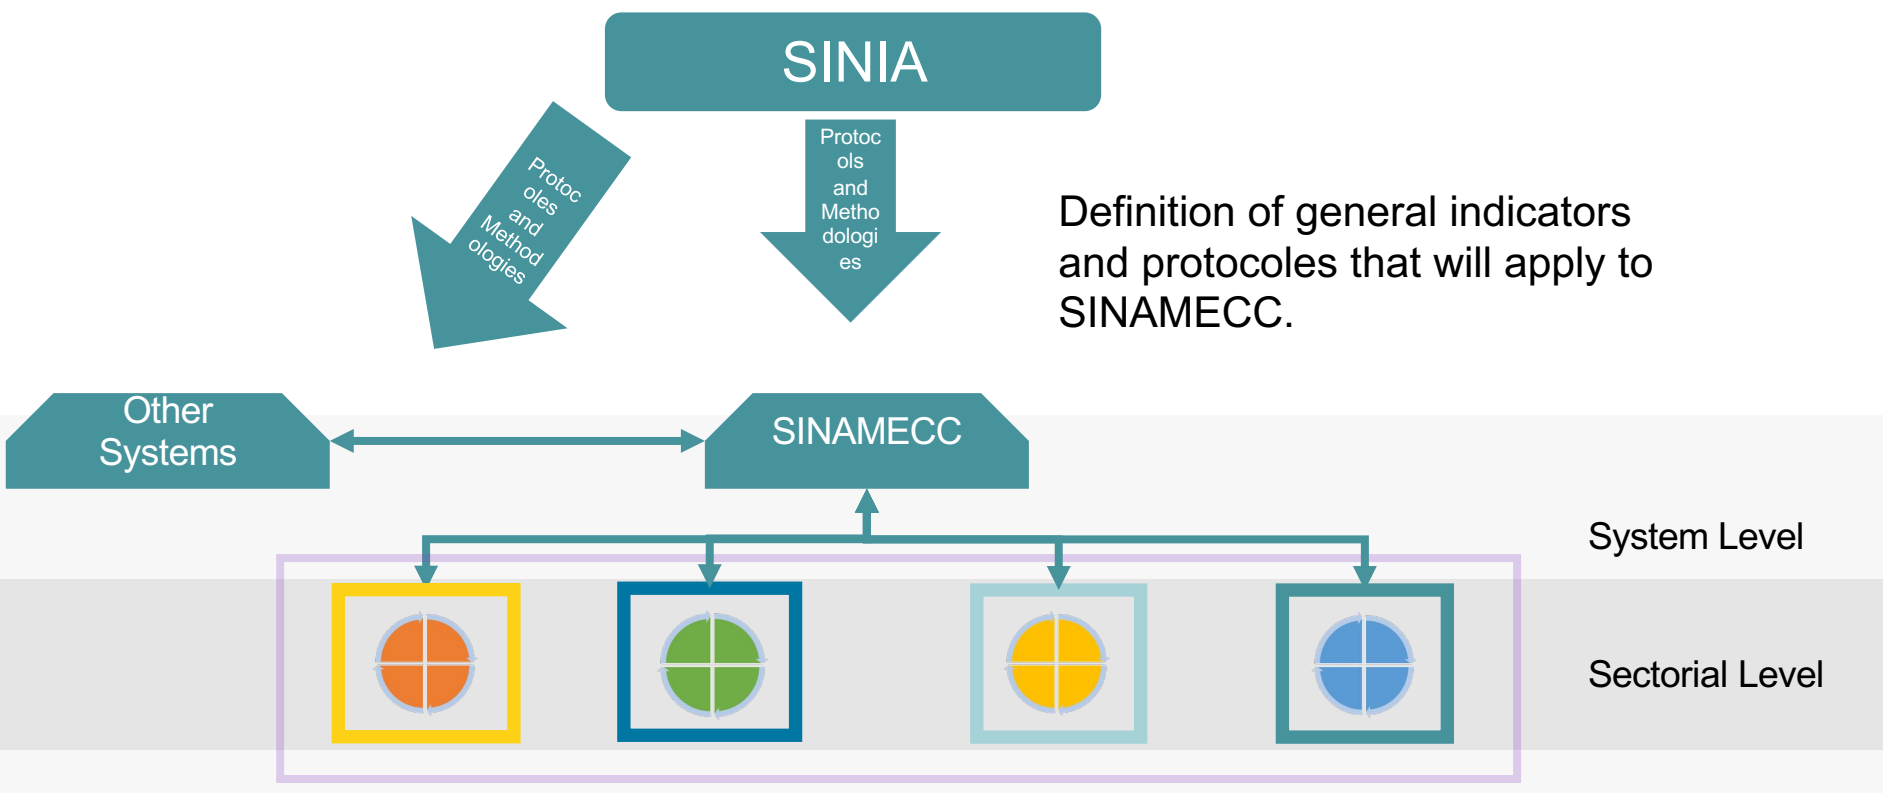

28,6% Livestock

Current Greenhouse gases National Inventory

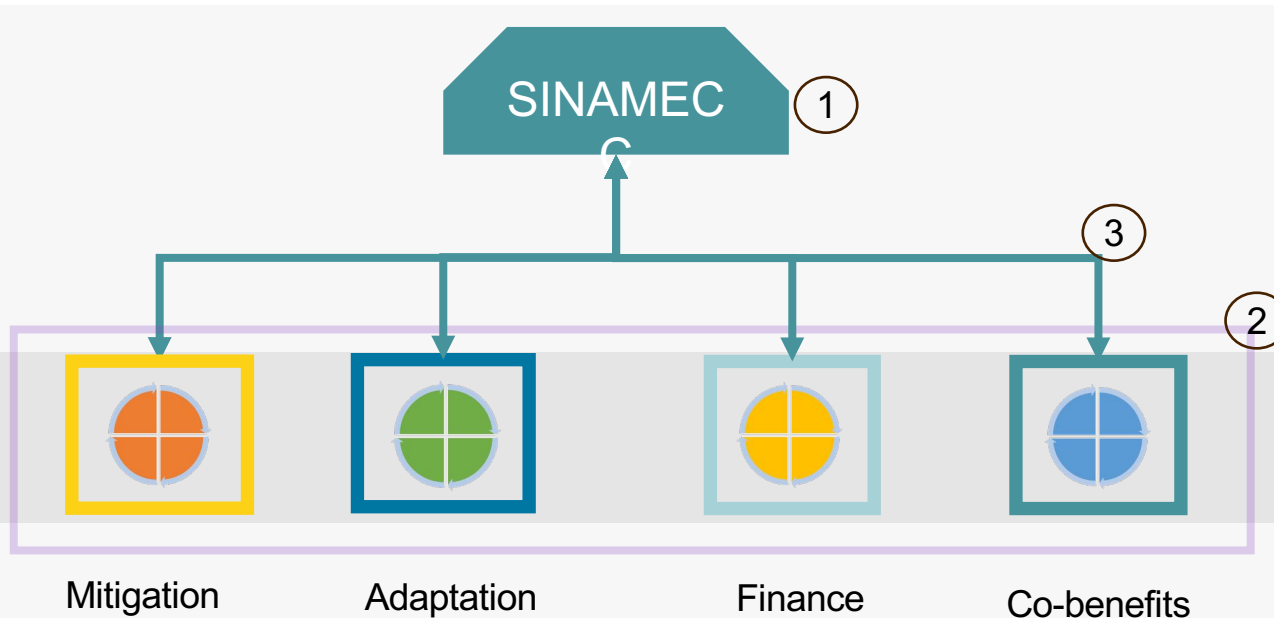

Climate Smart Development

Livestock sector substantial

INDC National Target 170.500 ton CO₂e/year in 2030

System Level

1. Gubernance of SINAMECC

ICAT y RdC – Definition of responsibilities–

2. Habilitant Framework

ICAT: Creation of a habilitant framework that facilitates the stablishment of interintitucional arragments for information.

3. Plataform

PMR: development of the plataform that also seeks the neccesity of carbon registries

What we need to capture mitigation?

➤ Activity data to capture mitigation

- **We need information related to grass extension (by grass specie according to production system)**
- **Frequent data of cattle population**
- **Data related to use of nitrogen fertilizer**
- **Mitigation options**

Innovations to get emission factors

- **Static chambers to develop national emission factors (N₂O)**
 - Better grazing systems

- **Implementation of a technique (sulfur hexafluoride, known as SF₆) to measure directly the enteric methane emitted by livestock**

THANK YOU!

Agripina Jenkins

RESEARCH PROGRAM ON
Climate Change,
Agriculture and
Food Security

Speaker 3: Zewdu Eshetu, Climate Science Center, Addis Ababa University, Ethiopia

A black and white cow is the central focus of the image, standing in a dirt enclosure. A person, wearing a white and blue patterned garment, is kneeling on the ground, milking the cow. The cow is tethered to a wooden post. In the background, there is a stone wall and a wooden fence. The text is overlaid on the upper part of the image.

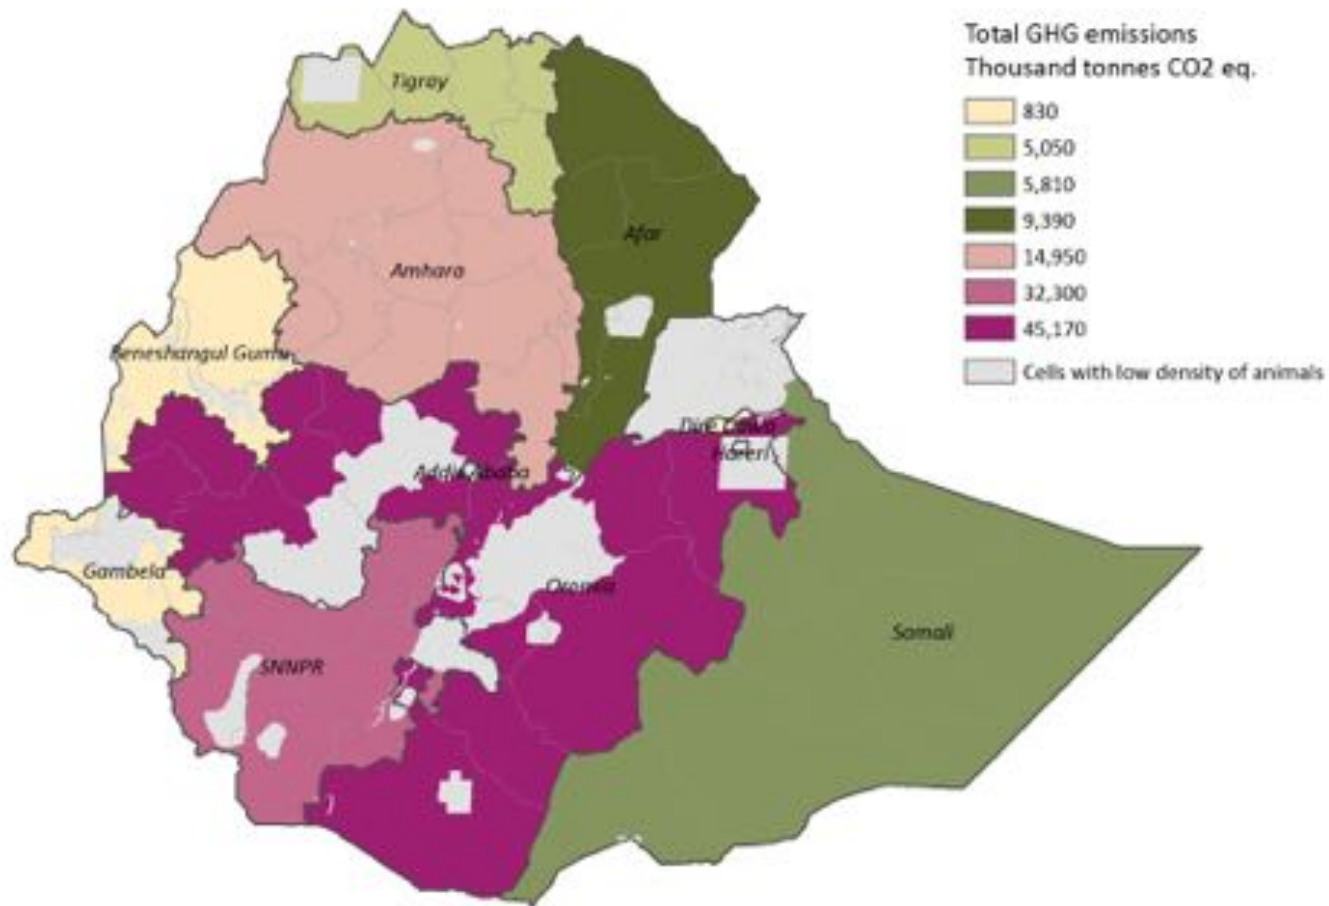

COP 22 Side Event
Improving MRV for Agricultural emission reduction
in the livestock sector: Ethiopian Dairy Sector
07 Nov. 2016
Mediterranean Room
Marrakech

Zewdu Eshetu CSC, AAU
Carolyn Opio, Livestock Policy Officer, FAO

CONTRIBUTION OF ETHIOPIAN DAIRY SECTOR TO EMISSIONS by production system: 161 MILLION TONNES CO₂ eq. PER ANNUM

CONTRIBUTION OF ETHIOPIAN DAIRY SECTOR TO EMISSIONS: 161 MILLION TONNES CO₂ eq. PER ANNUM

EFFICIENCY IN DAIRY SYSTEMS IN ETHIOPIA: EMISSION INTENSITY AND MILK YIELD

SELECTED TECHNICAL MITIGATION INTERVENTIONS

Practice	Benefits
1. Supplementation with leguminous shrubs	Improved animal and herd health Higher conception rates Improved weaning weights
2. Use of urea-molasses multi-nutrient blocks (UMMB)	Improved nutrition Increased intake
3. Use of urea-treated crop residues	Improved growth rates
4. Supplementation with low-cost high protein/energy concentrates	Improved nutrition Improved cow condition Improved reproductive performance Higher conception rates
5. Disease control (trypanosomiasis)	Reduction in mortality and morbidity Increase in animal productivity Improvements in reproductive performance (fertility, age at first calving)
6. Use of sexed semen	Better management of heifer replacement Reduction in cost for heifer purchase Genetically superior females
7. Conventional artificial insemination using superior genetics	Improved conception rates, calf survival Increased weaning weights Increased final weights

Activity data sources

- Multistage activity data set of primary and secondary
 - Total cattle and dairy population by production system
 - Feed basket by production system
 - Parameters of feed materials
 - digestibility and crude proteins
 - Manure management system (percent of manure burned, stored, slurry, solid, dried, spread over fields etc.)
 - Cattle herd parameters by production system
 - Bull to cow ration, death rate, replacement, live weight, daily weight gains, etc.
- **Sources of activity data:** CSA, Published, experts opinion, measured
- **Constraints** lack of uniformity in manure, feed and cattle management

Emission factors

$$\text{GHG} = A \times E_f$$

Emission factors are derived from multistage approach

- i. Methane production per milk cow production
- ii. Methane production per meat bull production

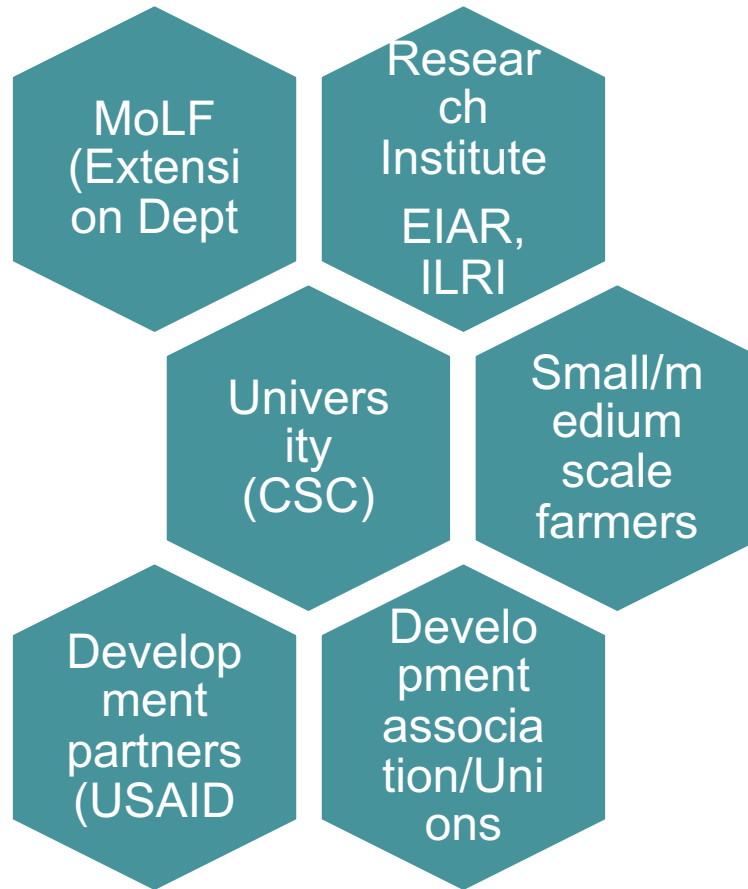

Constraints:

Methane production is affected by:

- Livestock health
- Feed quality
- Management
- Milk productivity

- i. for low emissions production systems?
 - Or problems that you face, e.g. we know from ILRI that IPCC efs probably don't reflect emissions of animals on submaintenance diets

Institutional coordination

THANK YOU

Food Security

Speaker 4: Bess Tiesnamurti, Indonesian Center for Animal Husbandry Research and Development

Indonesia's Approach in Improving its Livestock Emissions Inventory

Dr. Bess Tiesnamurti

**Director of
Indonesian Centre for Animal Research and Development**

Improving MRV for Agricultural Emission Reductions in the Livestock Sector
7 November 2016

II. Progress to date for Livestock Emission factor using Tier 2

Data used to get Emission factors Using Tier 2

Statistics Indonesia,
Directorat General
of Livestock and
Animal Health

Livestock
Population

- Type of Livestock
- Sub category

Feed Intake

- Type of diet
- Feed consumption

Experimental Results

Gross Energi
Intake

- GE content of diet
- proximate/Feedpedia

Experimental
Results

Methane
Conversion
Ratio

- IPCC 2006
guidance

= Emission Factor

Local Data combined with IPCC 2006

Trend of CH4 from enteric fermentation year 2006 to 2016 (Tier 1 vs Tier 2)

Mitigation technologies for enteric methane

- A. Feed Processing: Ensilage , ammoniation, fermentation
- B. Feed Supplement: Leguminouse leaves, balance ration
- C. Feed Additives:
 1. Saponin (Lerak /Sapindus lerak)
 2. Tannin (Acasia, Calliandra)
 3. Probiotic (*Acetoanaerobium noterae* and *A. woodii*)
 4. Complete rumen modifier (CRM)

Feed Additives

Extract saponin from *Sapindus rarak*

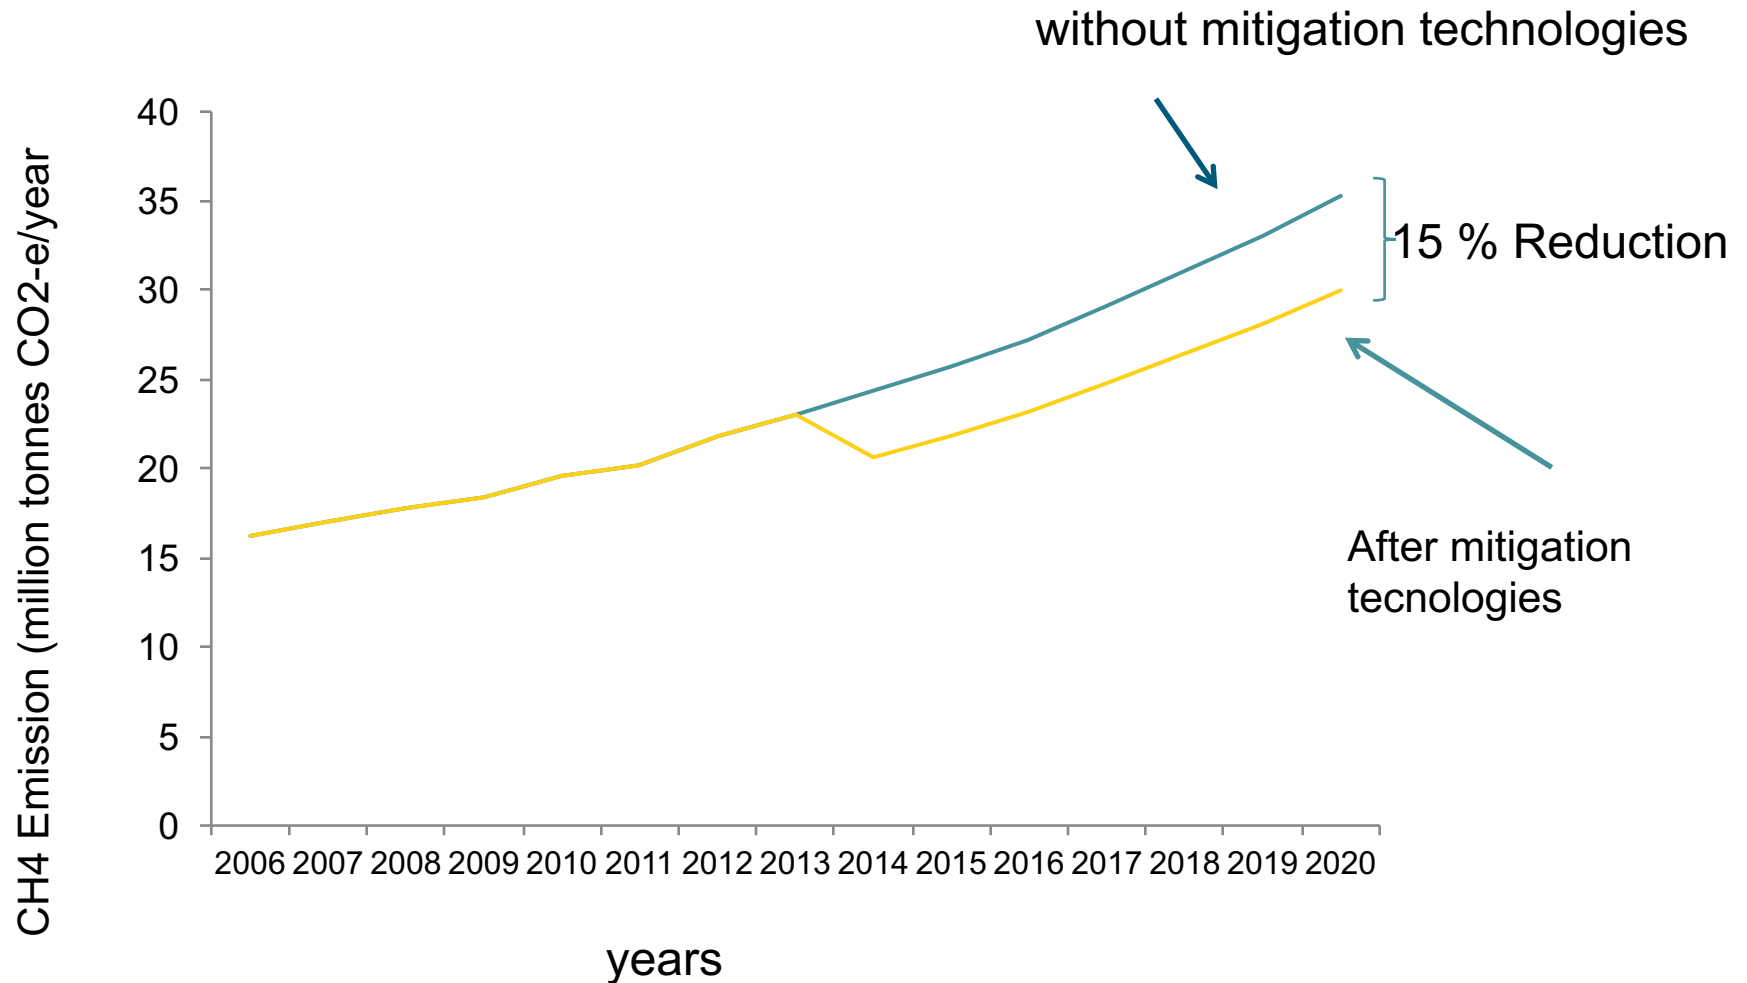

NO	Animal	PARAMETER	Results
1	Beef cattle ¹⁾	Average daily gain	20 % ↑
2	Sheep ²⁾	Average daily gain	40 – 44 %↑
		Feed Conversion Ratio	20 % ↑
		CH4 enteric emmited	31 % ↓

1) Astuti *et al.*, 2007.

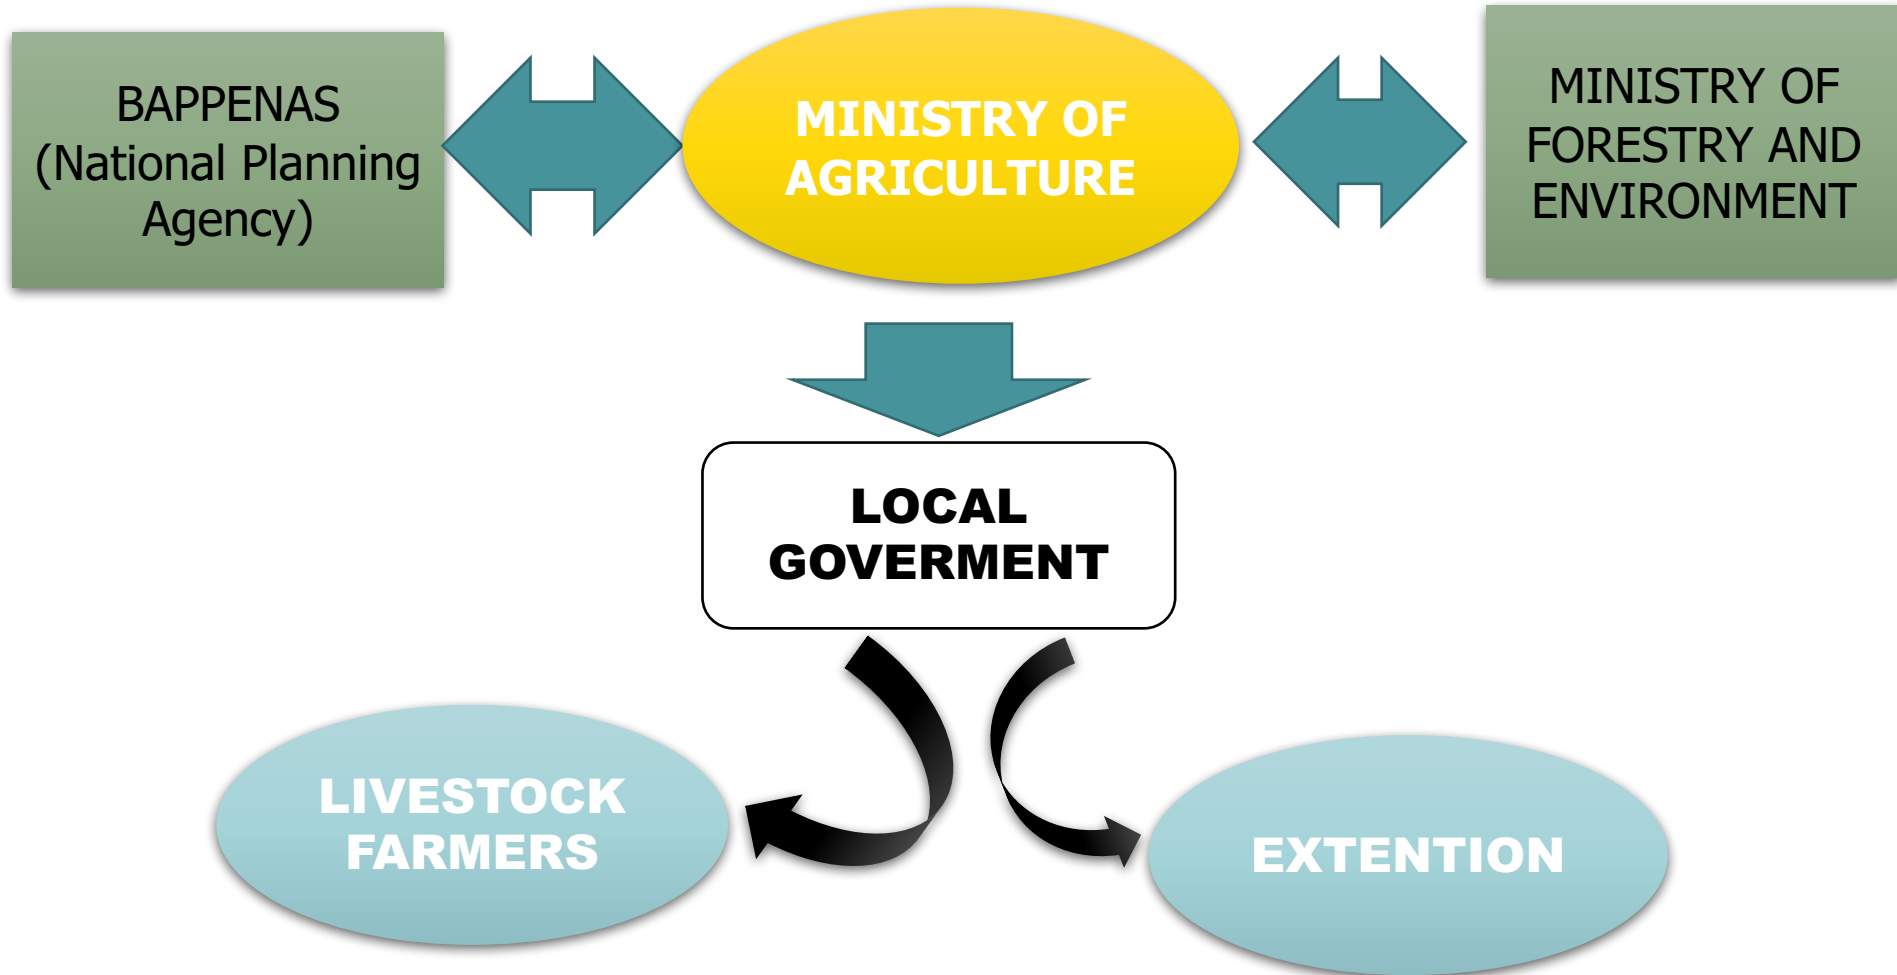

2) Amlius, 2004

Estimation of methane reduction after technologies mitigation were applied.

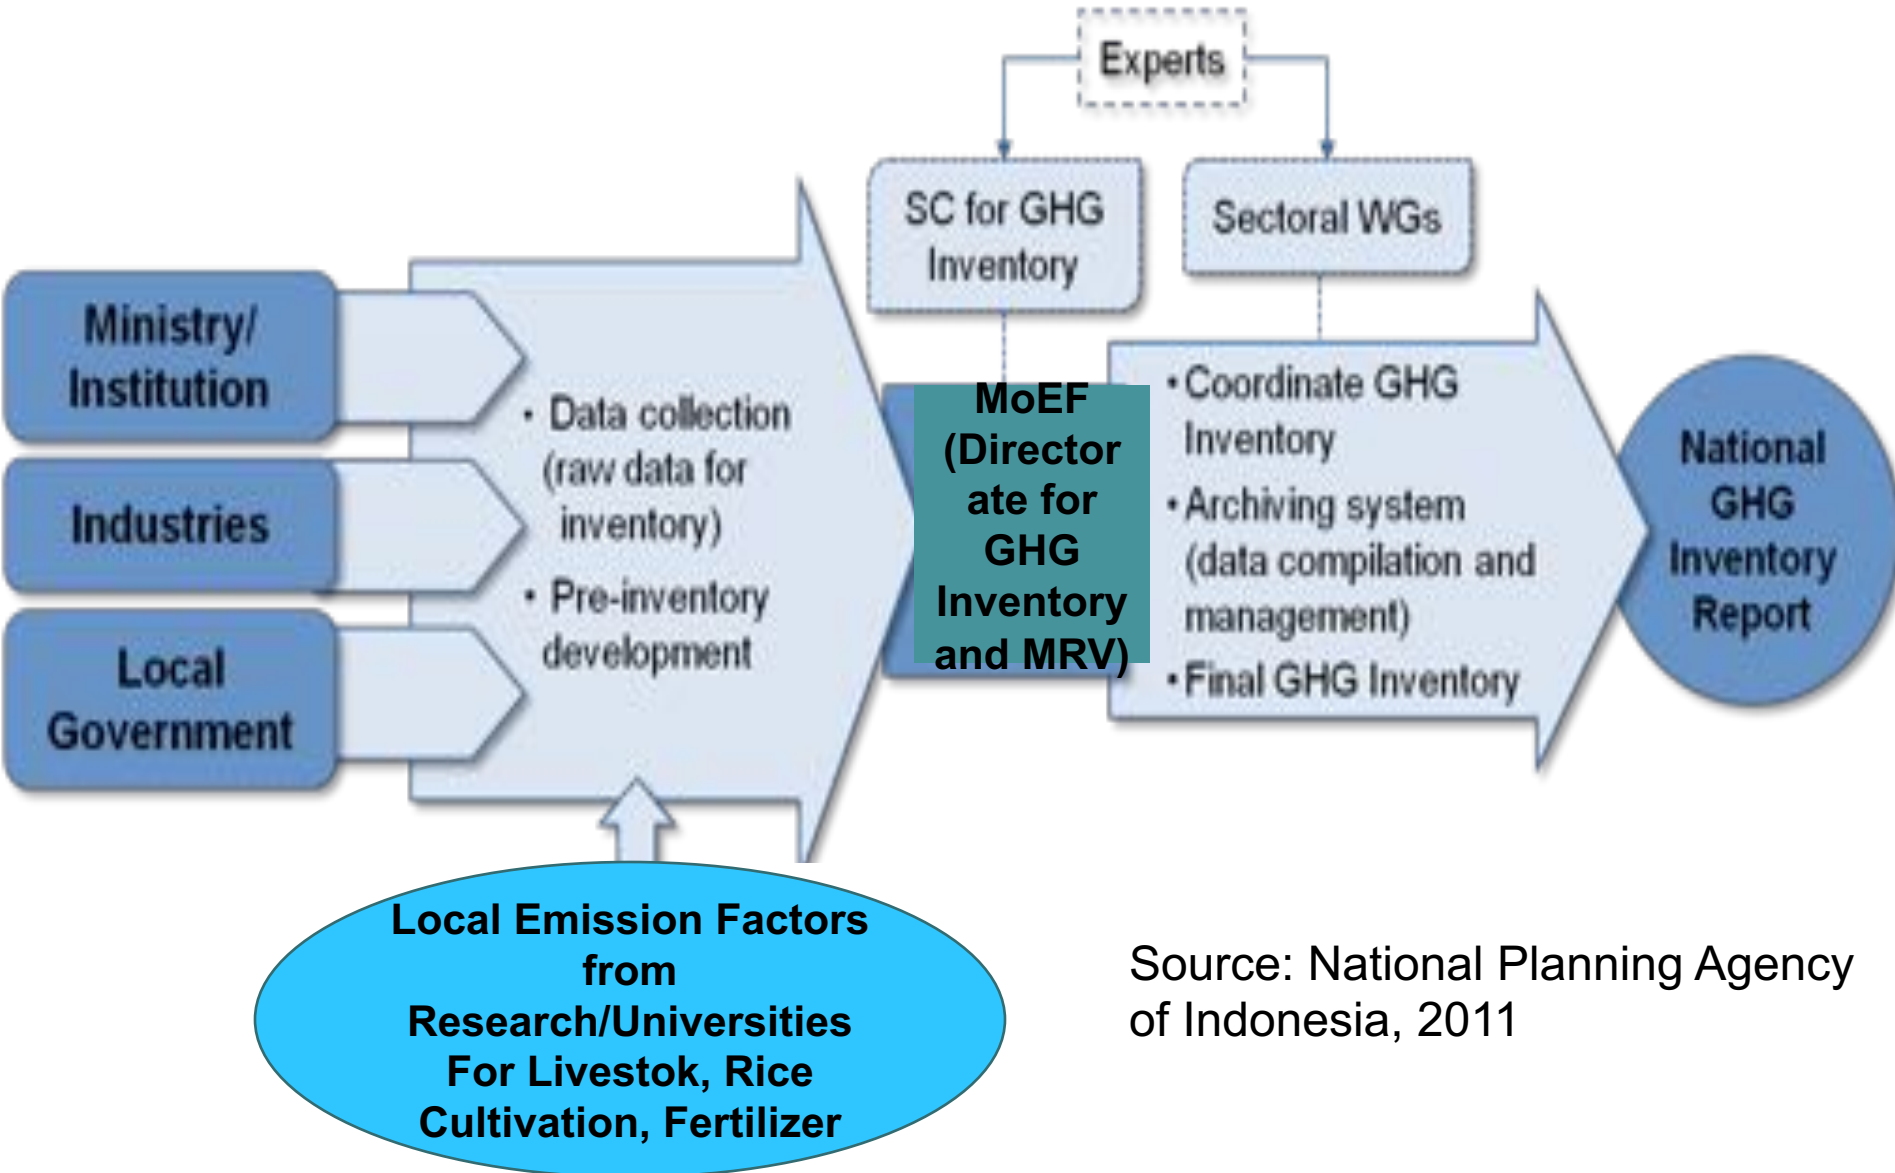

III. COORDINATION AMONG AGENCIES

Coordination to collect data

Institutional Arrangement for GHG Inventory in Indonesia

Food Security

Speaker 5: Alexandre Berndt, Brazilian Agriculture Research Corporation (EMBRAPA)

Improving MRV for agricultural emission reductions in the livestock sector: A perspective from Brazil

Alexandre Berndt
November 07, 2016

Activity data: Brazilian statistics IBGE – National Census.

Emission factors: IPCC Tier 2 + Local EF.

MCTI- National Inventories:

(MCT, 2006)

(MCT, 2010)

(MCTI, 2013)

(MCTI, 2014)

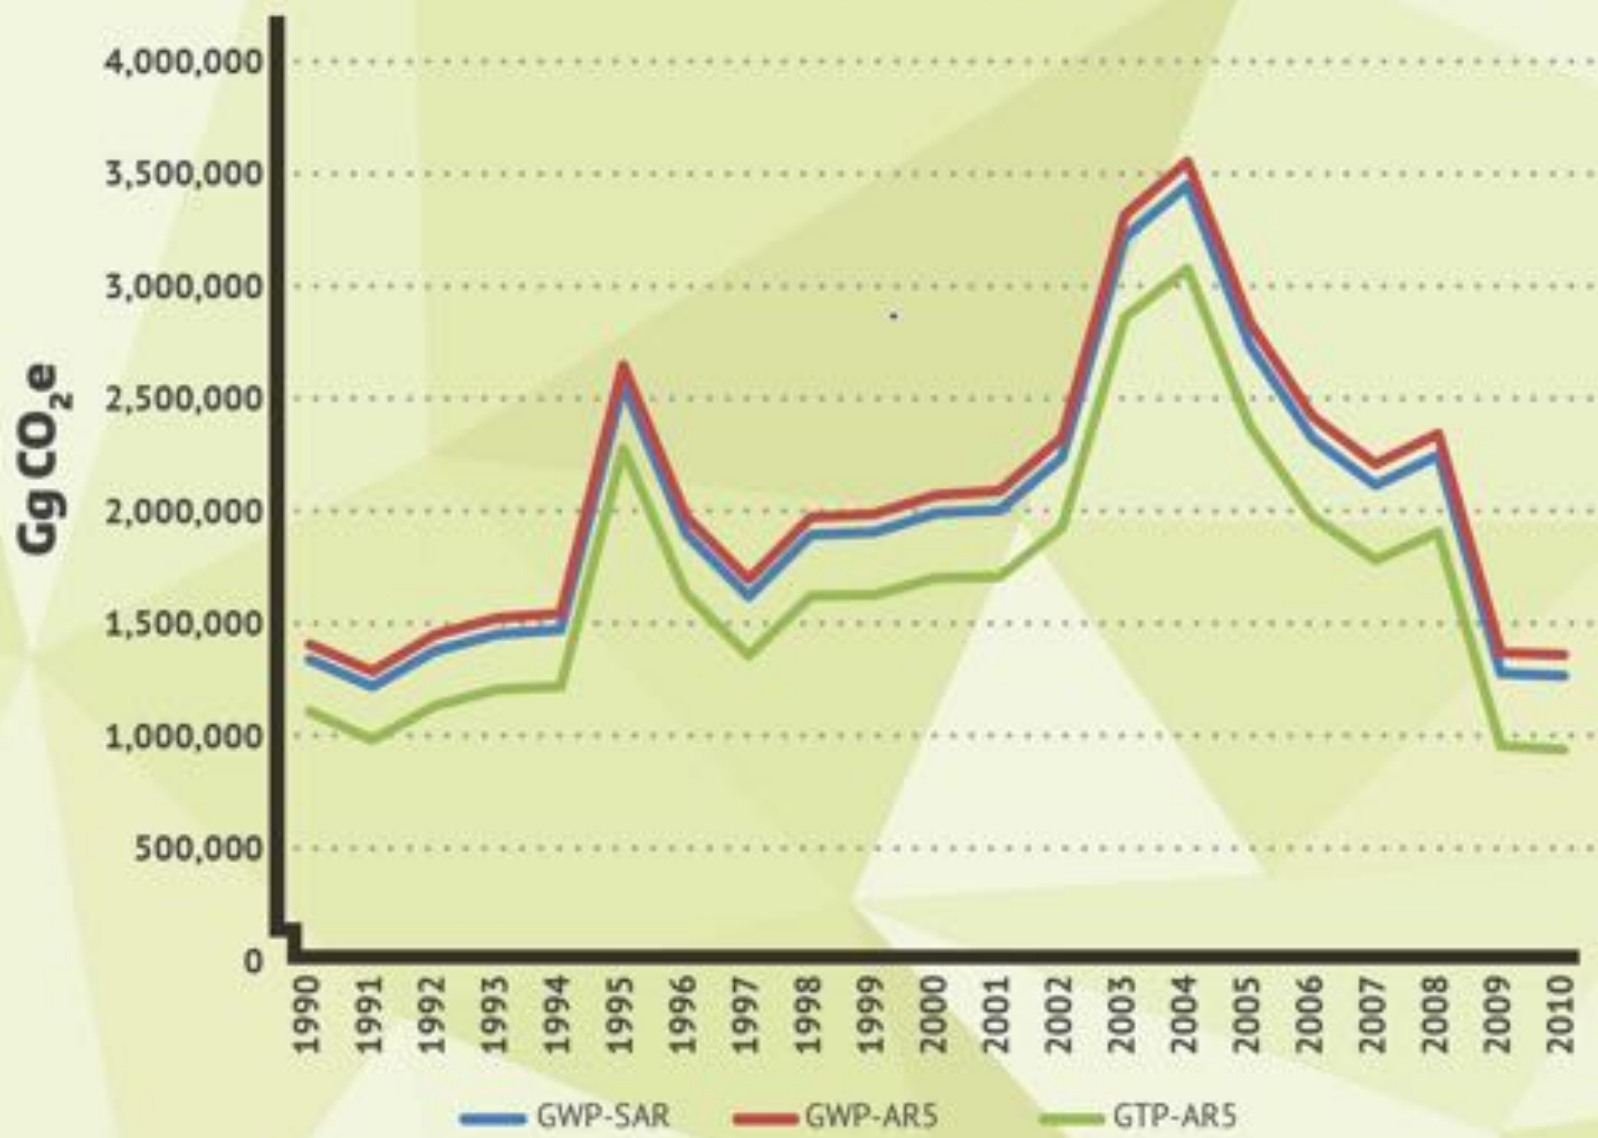

(MCTI, 2016)

FIGURE I

Evolution of CO₂e emissions by different metrics, 1990 to 2010

Brazilian Total Emissions

Agriculture emissions

Coordinated efforts

- National Policy on Climate Change;
 - Brazilian Forum on Climate Change (FBMC);
 - Brazilian Research Network on Global Climate Change (*Rede CLIMA*);
- Ministry of Science, Technology and Innovation (MCTI)
 - Sectoral Plan for the Mitigation and Adaptation to Climate Change for a Low Carbon Emission Agriculture (ABC Plan);
 - Special line of credit; Financial support for mitigation actions;
- ▶ ABC PLATFORM;
 - ▶ Converge data on GHG emissions from Agriculture;
 - ▶ Estimate the overall impact of the ABC PLAN
- ▶ Global Environment Facility (GEF);
- ▶ United Nations Development Programme (UNDP)

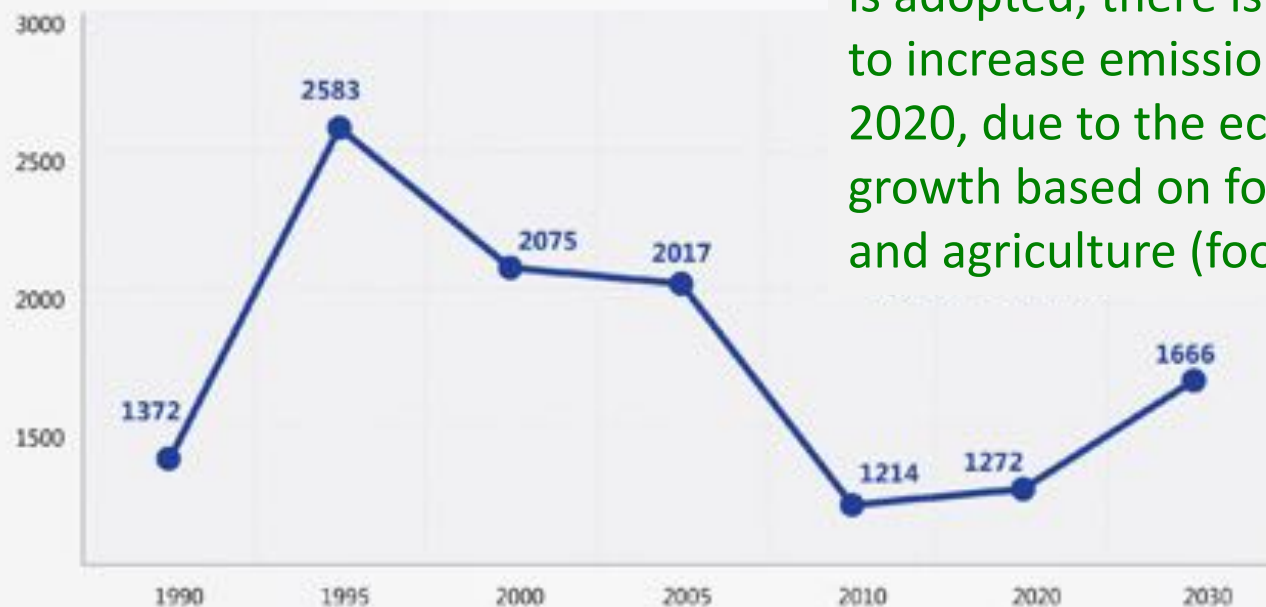

Motivation to measure GHG:

- INDC* presented at COP21 in Paris - Brazilian target for GHG reduction

À SEMELHANÇA DE OUTRAS INICIATIVAS, O IES-BRASIL CONCLUI:

GRÁFICO DE EMISSÕES (Mt CO₂e)

If no other mitigation strategy is adopted, there is a tendency to increase emissions after 2020, due to the economic growth based on fossil fuels and agriculture (food demand)

*Intended Nationally Determined Contribution

Thank you!
