

Mitigation and adaptation in African smallholder agriculture: Synergies and tradeoffs

Marcus Kaplan – German Development Institute

Side Event COP 16 „Low Carbon Development Strategies - Panacea or Placebo? “

December 6, 2010

Impacts of Climate Change on SSA

- temperature increase of 3 to 4°C in 2080 to 2099 (more than global average)
- Large uncertainties with regard to overall precipitation, changes in interannual variability, and extreme weather events
- effects of cc on crops uncertain, i.a. due to CO₂ fertilization effect

- absolute number of undernourished people increasing
- large increases in agricultural land up to 2050 (mostly rainfed)
- effects of cc on crops uncertain, i.a. due to CO₂ fertilization effect
- but: severe negative consequences with regard to harvests and thus economic output of agriculture

Future

SSA

Source: Lobell et al., 2008

GHG Emissions from SSA agriculture

- Africa responsible for 7.8 % of global anthropogenic emissions (14 % of world population)
- in the land-use and the biomass burning category Africa's share much higher (21 and 37 %, respectively)
- largest increases in agricultural emissions expected for SSA and Middle East/North Africa

Region	N ₂ O soils	CH ₄ enteric	CH ₄ rice	CH ₄ , N ₂ O manure	CH ₄ , N ₂ O burning	Total
Sub-Saharan Africa						
Mt CO ₂ -eq. year ⁻¹ in 1990	252	183	12	12	145	603
% change in 2005	39	34	81	33	-1	28
% change in 2020	102	77	172	83	-1	70

Resilience and response capacity

Adaptation and mitigation in agriculture

- Large synergies between adaptation and mitigation
- Further benefits for other ecosystem services (e.g., water quality)
- But also trade-offs => full production cycle to be considered
- Similar to REDD: MRV, leakage, additionality, permanence
- Adaptation and mitigation mostly discussed separately

Synergies and trade-offs between C sequestration and food security

Food
Security
Potential

Food Security Potential: High Carbon Sequestration Potential: Low • Expand cropping on marginal lands • Expand energy-intensive irrigation • Expand energy-intensive mechanized systems	Food Security Potential: High Carbon Sequestration Potential: High • Restore degraded land • Expand low energy-intensive irrigation • Change from bare to improved fallow • Agro-forestry options that increase food or incomes • Conservation tillage and residue management, limited trade-offs with livestock • Improved soil nutrient management
Food Security Potential: Low Carbon Sequestration Potential: Low • Bare fallow • Continuous cropping without use of organic or inorganic fertilization • Slope ploughing • Over grazing	Food Security Potential: Low Carbon Sequestration Potential: High • Reforestation/afforestation • Restore/maintain organic soils • Expand biofuel production • Agro-forestry options that yield limited food or income benefits • Conservation tillage and residue management, large trade-offs with livestock

Carbon
Sequestration
Potential

Source: FAO, 2009

- Minimum soil disturbance; crop rotation; permanent soil cover
- Increased soil C sequestration and yields?
- Redistribution of soil C compared to conventional agriculture
- Adverse impacts through herbicide application
- Or weeding done manually => additional work load
- Yields may decrease in the beginning
- Conflicts over crop residues

Implementing agricultural mitigation in SSA

- deficiencies in agricultural knowledge, low degree of mechanization, low input of improved seed varieties and fertilizers
=> low productivity
- large diversity of agroecosystems (=> green revolution)
- poor access to input and output markets
- education => diversification => more investment in sustainable agricultural practices => mitigation
- Intensification on existing agricultural land or expansion to previously unused land?

- Agriculture largely excluded from CDM
- High fragmentation, high transaction costs
- Unclear property rights and access to land
- Up-front costs for additional investments => widening the gap between poor and wealthier groups
- NAMAs to explore „low-hanging fruits“
- No linkages between NAPAs and NAMAs

Agricultural mitigation in NAMAs

Country	Livestock	Crop land	Waste	Peat land
CAR	-	Crop improvement	Crop res., animal waste	-
DR. Congo	-	1. Conservation farming 2. N-fixing species 3. Irrigation	-	-
Ivory Coast	-	Conservation farming	-	-
Ethiopia	-	1. Agroforestry 2. Soil C-sequestration	-	-
Eritrea	-	Soil C-sequestration	-	-
Ghana	-	1. Conservation tillage 2. Efficient fertilizer app 3. Crop improvement	Crop res. and animal waste	Improved mgt.
Madagascar	1. Improved livestock mgt. 2. fodder crops	1. Efficient fertilizer appl. 2. Crop improvement	-	-
Sierra Leone	-	1. Conservation farming 2. Agro-forestry		

Conclusions and recommendations

- need to deal with complexity - multiple hierarchical levels; large number of stakeholders; linkages within the system
- large importance of agriculture for poverty reduction
- Go for comprehensive agricultural strategies
- Collaborative adaptive management and social learning
- Higher priority of agriculture is needed
- Capacity building for flexible institutions (horizontal and vertical)
